

Sample Questions:

1. Sketch the framework of artificial neuron with the help of a neat diagram
2. Restate the Mc-Culloch Pitts Neuron
3. Associate between artificial neuron and biological neuron
4. Define perceptron
5. Model logic gate functions with MP neuron
6. Summarize the application of multilayer perceptron
7. Describe Perceptron learning and Delta learning in neural network
8. Interpret the categorization of linearly separable and linearly non-separable classes
9. Discuss the journey of / research in artificial neural network from Perceptron to Deep Network
10. List and summarize the various classes of deep learning
11. Justify - "Introduction of nonlinear functions allows neural networks to learn more complex functions."
12. List the learning factors of Multi Layered Feed Forward Neural Network
13. Summarize the various activation functions
14. Compare Nesterov Accelerated GD and AdaGrad
15. Determine the method / process to model a well generalized network if a network only memorizes the patterns in the input dataset.
16. Analyze how the Feed Forward Neural Network learns itself.
17. How is AdaGrad used to optimize learning rate?
18. Associate between learning representation of data and dimensionality reduction in neural network.
19. Summarize Denoising Autoencoders, Sparse Autoencoders and Contractive Autoencoders .
20. Construe the inevitability of image compression for the image processing

applications.

21. Given an unlabeled image. Is it possible to automatically represent the given image as a fixed-sized vector? How?
22. List different learning parameters with their pros and cons
23. How can NN obtains output using activation function? Elaborate in brief.
24. List the factors influencing the backpropagation training of ANN
25. Differentiate between cost function and gradient descent
26. Sketch and explain the architecture of Autoencoders
27. How does a Deep Neural Network resist the Curse of Dimensionality?
